

## **Manlift Certification Richmond Hill**

Manlift Certification Richmond Hill - The Elevated Platforms and Manlifts Certification program helps to provide the necessary training on the safe operating procedures, work practice, regulations and rules regarding the everyday activities for the operators of this equipment. The program has been designed for individuals who are actively involved in these activities or those who have a basic understanding of this equipment.

During the last couple of decades, manlifts and aerial platforms have become a common sight in industrial maintenance applications and on construction job sites. These machines provide an easy way to lift staff near what has to be carried out on a stable platform apparatus, enabling workers to do tasks with greater safety and comfort rather than being perched on top of scaffolding or ladders.

The manlift is similar to other industrial devices in that they are safe when used correctly. Because they elevate staff above floor or ground level, accidents can occur easily and this might lead to serious fatalities or injuries for both the manlift operators and any passerby who may be unlucky enough to be standing beneath.

There are different models of manlifts. The majority fall into 1 of 2 categories: the articulating boom lift, which has the capability of both vertical and horizontal movement and the scissors lift, that is capable of moving up and down.

### **Protecting Staff**

Proper training is vital in regard to safety matters. A lot of the businesses which rent manlifts would provide training at the jobsite. Every worker who will be working on the machine or operating it has to receive training in safe operations. It is also vital that just those employees who have received training must be authorized to operate the controls. Communication rules and operating procedures must be clear. Hence, staff on the ground should not operate controls without the knowledge and approval of any employees inside the basket.

Those staff who will be occupying the basket are required to wear right fall protection like for instance lanyard and a harness. That protection should be connected to the manlift itself and not to a nearby surface. The employee needs to make certain that she or he has made any adjustments required to reflect the change in fall distance if there are changes in the height of the work area.

To make sure that the manlift is in good operating condition, manlifts must be inspected and tested every day. Prior to utilizing the machine, whichever defects have to be re-checked and repaired.
